WHATSNEXT VISION MOTORS

Salesforce CRM Implementation for Vehicle Ordering and Dealer Operations

Program	Naan Mudhalvan
Project Domain	Salesforce CRM / Automotive
Core Technologies	Salesforce CRM, Apex Triggers, Batch Apex, Scheduled Apex, Automated Workflows

1. Project Overview

WhatsNext Vision Motors aims to improve customer experience and operational efficiency through a Salesforce CRM-based vehicle ordering solution. The system supports dealer assignment based on customer location, validates vehicle stock before accepting orders, updates order statuses through automation, and sends scheduled reminders for test drives.

2. Problem Statement

Manual vehicle-order handling can lead to incorrect dealer allocation, orders for unavailable vehicles, delayed status updates, and missed test-drive reminders. These issues can reduce customer satisfaction and create avoidable work for dealership teams.

3. Project Objectives

- Automatically assign each vehicle order to the nearest suitable dealer using the customer's location.
- Prevent orders from being processed when the requested vehicle is out of stock.
- Keep order statuses updated through automated processing.
- Send scheduled email reminders for upcoming test drives.
- Improve order accuracy, consistency, and operational efficiency.

4. Key Features

- **Location-based dealer assignment:** Route customer orders to the nearest dealer using the available location information.
- **Stock validation:** Check vehicle availability before an order is accepted or processed.
- **Automated order status updates:** Update order progress as defined by the business workflow.
- **Test-drive reminders:** Send scheduled email notifications to help customers remember their appointments.
- **Stock synchronization:** Run batch processing to update stock-related records efficiently.

5. Technical Implementation

- **Apex Triggers:** Validate vehicle stock during relevant order operations and help prevent invalid orders.
- **Batch Apex:** Process stock updates across multiple records in manageable batches.
- **Scheduled Apex:** Run order-processing tasks automatically at configured times.
- **Salesforce Automation:** Coordinate order status changes and scheduled test-drive email reminders.

6. High-Level Workflow

Customer submits a vehicle order → Salesforce checks vehicle stock → the system identifies the nearest suitable dealer → the order is processed and its status is updated → scheduled automation sends test-drive reminders when applicable → stock-related records are updated through batch processing.

7. Expected Outcomes

- Fewer orders placed for unavailable vehicles.
- More consistent dealer assignment and order handling.
- Timely order-status updates and test-drive reminders.
- Reduced manual follow-up for dealership staff.
- A more reliable and customer-friendly vehicle ordering experience.

8. Conclusion

The WhatsNext Vision Motors project demonstrates how Salesforce CRM and Apex automation can support an efficient automotive order-management process. By combining stock validation, location-based dealer assignment, automated status updates, batch stock processing, and scheduled reminders, the solution is designed to improve service quality and streamline dealership operations.

Project summary prepared for Naan Mudhalvan documentation and GitHub submission. Implementation details should be aligned with the actual Salesforce configuration and code used in the project.
